Docket No.: 60674(49381)

**AMENDMENTS TO THE CLAIMS**

This listing of claims will replace all prior versions, and listing, of claims in the application.

**Listing of Claims**

1 (Currently amended). A sheet feeding apparatus comprising:

- a sheet container for containing a plurality of stacked sheets;
- an elevation/lowering driving unit for elevating and lowering the sheet container;
- a sheet conveying unit for sequentially taking out the sheets from an uppermost layer put in contact with the sheet conveying unit by elevating the sheet container by the elevation/lowering driving unit and conveying the sheets to a predetermined conveyance path;
- a regulating unit provided so as to be slidable on the sheet container for regulating a set position of a sheet;
- a position detector for detecting a position of the regulating unit; and
- a contact detector for detecting a contact state between the uppermost layer of the sheets contained in the sheet container and the sheet conveying unit,
- wherein the elevation/lowering driving unit lowers the sheet container when a change in the position of the regulating unit is detected by the position detector in a state in which the uppermost layer of the sheets contacts the sheet conveying unit;
- and further comprising:
- a receiving unit for receiving information input externally for setting according to a lowered amount of the sheet container; and
- a storage for storing the received information,
- wherein the elevation/lowering driving unit lowers the sheet container by the lowered amount stored in the storage when the position detector detects a change in the position of the regulating unit.

2 (Original). The sheet feeding apparatus according to Claim 1, wherein the elevation/lowering driving unit lowers the sheet container until the uppermost layer of

After Final Office Action of July 13, 2007

3

Docket No.: 60674(49381)

the sheets and the sheet conveying unit are separated when the position detector detects a change in the position of the regulating unit.

3. Cancelled.

4 (Original). The sheet feeding apparatus according to Claim 1, further comprising a measuring unit for measuring a dimension of a sheet contained in the sheet container based on a detection result of the position detector.

5 (Original). The sheet feeding apparatus according to Claim 1, further comprising a clocking unit, wherein the elevation/lowering driving unit elevates the sheet container when a change in the position of the regulating unit is not detected for a predetermined time.

6 (Currently amended). A sheet feeding apparatus comprising:  
sheet containing means for containing a plurality of stacked sheets;  
elevation/lowering driving means for elevating and lowering the sheet containing means;  
sheet conveying means for sequentially taking out the sheets from an uppermost layer put in contact with the sheet conveying means by elevating the sheet containing means by the elevation/lowering driving means and conveying the sheets to a predetermined conveyance path;  
regulating means provided so as to be slideable on the sheet containing means for regulating a set position of a sheet;  
position detecting means for detecting a position of the regulating means; and  
contact detecting means for detecting a contact state between the uppermost layer of the sheets contained in the sheet containing means and the sheet conveying means,  
wherein the elevation/lowering driving means lowers the sheet containing means when a change in the position of the regulating means is detected by the position detecting means in a state in which the uppermost layer of the sheets contacts the sheet conveying means;

Application No. 10/772,771  
After Final Office Action of July 13, 2007

4

Docket No.: 60674(49381)

and further comprising:

a receiving unit for receiving information input externally for setting according to  
a lowered amount of the sheet container; and

a storage for storing the received information,

wherein the elevation/lowering driving unit lowers the sheet container by the  
lowered amount stored in the storage when the position detector detects a change in  
the position of the regulating unit.

7 (Original). The sheet feeding apparatus according to Claim 6, wherein the  
elevation/lowering driving means lowers the sheet containing means until the  
uppermost layer of the sheets and the sheet conveying means are separated when the  
position detecting means detects a change in the position of the regulating means.

8. Cancelled.

9 (Original). The sheet feeding apparatus according to Claim 6, further comprising  
measuring means for measuring a dimension of a sheet contained in the sheet  
containing means based on a detection result of the position detecting means.

10 (Original). The sheet feeding apparatus according to Claim 6, further comprising  
clocking means, wherein the elevation/lowering driving means elevates the sheet  
containing means when a change in the position of the regulating means is not detected  
for a predetermined time.

11 (Currently amended). An image reading apparatus comprising:  
a sheet container for containing a plurality of stacked sheets;  
an elevation/lowering driving unit for elevating and lowering the sheet container;  
a sheet conveying unit for sequentially taking out the sheets from an uppermost  
layer put in contact with the sheet conveying unit by elevating the sheet container by  
the elevation/lowering driving unit and conveying the sheets to a predetermined  
conveyance path;

Application No. 10/772,771  
After Final Office Action of July 13, 2007

5

Docket No.: 60674(49381)

an image reading unit for reading an image on a sheet conveyed by the sheet conveying unit;

a regulating unit provided so as to be slidable on the sheet container for regulating a set position of a sheet;

a position detector for detecting a position of the regulating unit; and

a contact detector for detecting a contact state between the uppermost layer of the sheets contained in the sheet container and the sheet conveying unit,

wherein the elevation/lowering driving unit lowers the sheet container when a change in the position of the regulating unit is detected by the position detector in a state in which the uppermost layer of the sheets contacts the sheet conveying unit;

and further comprising:

a receiving unit for receiving information input externally for setting according to a lowered amount of the sheet container; and

a storage for storing the received information,

wherein the elevation/lowering driving unit lowers the sheet container by the lowered amount stored in the storage when the position detector detects a change in the position of the regulating unit.

12 (Original). The image reading apparatus according to Claim 11, wherein the elevation/lowering driving unit lowers the sheet container until the uppermost layer of the sheets and the sheet conveying unit are separated when the position detector detects a change in the position of the regulating unit.

13. Cancelled.

14 (Original). The image reading apparatus according to Claim 11, further comprising a measuring unit for measuring a dimension of a sheet contained in the sheet container based on a detection result of the position detector.

15 (Original). The image reading apparatus according to Claim 11, further comprising a clocking unit, wherein the elevation/lowering driving unit elevates the sheet container

Application No. 10/772,771  
After Final Office Action of July 13, 2007

6

Docket No.: 60674(49381)

when a change in the position of the regulating unit is not detected for a predetermined time.

16 (Currently amended). An image forming apparatus comprising:

- a sheet container for containing a plurality of stacked sheets;
- an elevation/lowering driving unit for elevating and lowering the sheet container;
- a sheet conveying unit for sequentially taking out the sheets from an uppermost layer put in contact with the sheet conveying unit by elevating the sheet container by the elevation/lowering driving unit and conveying the sheets to a predetermined conveyance path;
- an image forming unit for forming an image on a sheet conveyed by the sheet conveying unit;
- a regulating unit provided so as to be slidable on the sheet container for regulating a set position of a sheet;
- a position detector for detecting a position of the regulating unit; and
- a contact detector for detecting a contact state between the uppermost layer of the sheets contained in the sheet container and the sheet conveying unit,

wherein the elevation/lowering driving unit lowers the sheet container when a change in the position of the regulating unit is detected by the position detector in a state in which the uppermost layer of the sheets contacts the sheet conveying unit;

and further comprising:

- a receiving unit for receiving information input externally for setting according to a lowered amount of the sheet container; and
- a storage for storing the received information,

wherein the elevation/lowering driving unit lowers the sheet container by the lowered amount stored in the storage when the position detector detects a change in the position of the regulating unit.

17 (Original). The image forming apparatus according to Claim 16, wherein the elevation/lowering driving unit lowers the sheet container until the uppermost layer of the sheets and the sheet conveying unit are separated when the position detector detects a change in the position of the regulating unit.

Application No. 10/772,771  
After Final Office Action of July 13, 2007

7

Docket No.: 60674(49381)

**18. Cancelled**

**19 (Original).** The image forming apparatus according to Claim 16, further comprising a measuring unit for measuring a dimension of a sheet contained in the sheet container based on a detection result of the position detector.

**20 (Original).** The image forming apparatus according to Claim 16, further comprising a clocking unit, wherein the elevation/lowering driving unit elevates the sheet container when a change in the position of the regulating unit is not detected for a predetermined time.
